

2025 ICPC team note

Slower than Python3

Nov 2025

Contents

1 Data Structure

- 1.1 Fenwick Tree
- 1.2 Segment Tree
- 1.3 Lazy Segment Tree
- 1.4 Persistent Segment Tree
- 1.5 PBDS
- 1.6 Mo's algorithm
- 1.7 HLD
- 1.8 Knuth Optimization
- 1.9 Linear Convex Hull Trick

2 Graph

- 2.1 Dijkstra
- 2.2 Least Common Ancestor
- 2.3 2-SAT
- 2.4 SCC
- 2.5 Eulerian Tour
- 2.6 Euler Tour
- 2.7 Graph Coloring

3 Flows / Matchings

- 3.1 Min Cost Max Flow
- 3.2 Dinic
- 3.3 Bipartite matching

4 Strings

- 4.1 Aho Corasic
- 4.2 KMP
- 4.3 Trie

where the path integral is taken counterclockwise.

Shoelace Lemma

Burnside's Lemma

$$|X/G| = \sum_{g \in G} |X^g|$$

Pisano Period Pisano Period refers to the period with which Fibonacci numbers mod some P repeats. In other words, for some modulus P, its Pisano Period is equal to some M such that

$$F_a \equiv F_{(a\%M)} \pmod{P} \quad \forall a.$$

for moduli of form 10^k , its $15 * 10^k$.

Euler Characteristics For a planar graph, the following identity holds:

$$x = V - E + F$$

where V = vertices, E = edges, F = faces

König's Theorem For all Graphs, Minimum Cut = Max flow

Only for **Bipartite Graphs**: Minimum Vertex Cover = Minimum Cut = Max flow (König's Theorem)
